PT. XYZ adalah sebuah perusahaan fintech yang ingin mengembangkan mobile apps mereka, dalam upaya menjangkau pengguna yang lebih luas mereka ingin mengembangkan aplikasi pinjaman online.

1. Coba deskripsikan tentang diagram berikut ini :

Answer:

Alur Proses Utama:

1. User membuka Mobile App dan melakukan login.
2. Mobile App mengirim request ke API/Application Services.
3. Application Services memproses bisnis dan memanggil SOA.
4. SOA mengorkestrasi request ke external API (Dukcapil, BPJS, SLIK, dll) & Core Banking System.
5. External API / Core Banking System mengembalikan response.
6. SOA meneruskan response ke Application Services.
7. Application Services mengembalikan hasil ke Mobile App.
8. Seluruh aktivitas dicatat dan dimonitor oleh Kibana.

Catatan:

- Jenkins digunakan untuk proses CI/CD (build, test, deploy).
- Kibana berfungsi untuk monitoring dan troubleshooting seluruh alur integrasi.
- SOA menjadi layer orkestrasi dan integrasi antar sistem.

Image	Komponen	Posisi	Fungsi
 The diagram shows a 'Mobile App (Fintech Lending App)' box. An arrow labeled '1. Login / Auth' and '2. API Request' points from the app to the right. A return arrow labeled 'Response / Result' points from the right back to the app.	Mobile App	Frontend	Berfungsi sebagai antarmuka pengguna untuk authentication, pengiriman API request, dan penerimaan hasil proses layanan fintech lending.
 This diagram illustrates the SOA / Integration Layer as a central hub. It includes components like 'API Orchestration', 'Routing', 'Transformation', and 'Validation'. It shows data flow between 'External API / Third Party Systems', 'CORE BANKING SYSTEM' (with sub-components: Loan Account, Loan Booking, Disbursement, Repayment), and 'Kibana Monitoring & Log' (with sub-components: API Logs, Error Tracking, Latency, Transaction Monitoring). Numbered steps (1-11) indicate the sequence of operations, including request processing, data exchange, and monitoring.	SOA / Integration Layer	Tengah / orchestration layer	Berfungsi sebagai penghubung antar-sistem yang menangani API orchestration, routing, transformation, dan validation.
 This diagram focuses on the 'CORE BANKING SYSTEM' and its interaction with the 'SOA / Integration Layer'. The SOA layer handles 'API Orchestration', 'Routing', 'Transformation', and 'Validation'. The Core Banking System handles 'Loan Account', 'Loan Booking', 'Disbursement', and 'Repayment'. A 'Banking Process / Transaction' is shown as a key interaction point between the two.	Core Banking System	Backend / system of record	Menangani proses utama setting up rules, loan lifecycle, meliputi loan account, booking, disbursement, repayment, dan transaction processing.
 This diagram highlights the 'Kibana (Monitoring & Log)' layer. It shows how the SOA / Integration Layer feeds data into Kibana for monitoring. The SOA layer components are 'API Orchestration', 'Routing', 'Transformation', and 'Validation'. Kibana's components are 'API Logs', 'Error Tracking', 'Latency', and 'Transaction Monitoring'. The flow includes 'Log & Monitoring (Req/Resp, Error, Latency)' from the SOA layer to Kibana.	Kibana	Monitoring layer	Monitoring log, API request/response, error, latency, transaction status
